### 1.1 Module contents

Python client to communicate with a ftDuino via USB.

It uses the `ftduino_direct` sketch written by Peter Habermehl. See <[https://github.com/PeterDHabermehl/ftduino\\_direct](https://github.com/PeterDHabermehl/ftduino_direct)>

**class** `ftdu.BaseFtDuino` (*path=None*)

Base class to communicate with a ftDuino.

This class implements all high level functions of the ftDuino API.

To issue other commands, the `comm()` method can be used.

**close()**

Closes the connection to the ftDuino.

Use the `with` statement to ensure that this method is called.

```
with BaseFtduino() as ftd:
    ftd.led = True
```

**comm** (*cmd*)

Low level access to the ftDuino.

See <[https://github.com/PeterDHabermehl/ftduino\\_direct#use](https://github.com/PeterDHabermehl/ftduino_direct#use)> for a list of commands.

**Parameters** `cmd` – The command to execute.

**Return type** `str`

**Returns** The result of the command or `None` in case of an error.

**counter\_clear** (*port*)

Clears the provided counter port.

**Parameters** `port` – Port name, i.e. 'C1'. The port name is case-insensitive.

**counter\_get** (*port*)

Returns the value of the provided counter port.

**Parameters** **port** – Port name, i.e. ‘C1’. The port name is case-insensitive.

**Return type** `int`

**Returns** The value of the provided counter.

**counter\_get\_state** (*port*)

Returns the state of the provided counter port.

**Parameters** **port** – Port name, i.e. ‘C1’. The port name is case-insensitive.

**Return type** `bool`

**Returns** The state, a boolean of the port.

**counter\_set\_mode** (*port, mode*)

Sets the mode of the provided counter.

**Parameters**

- **port** – Port name, i.e. ‘C1’. The port name is case-insensitive.
- **mode** – ‘none’, ‘rising’, ‘falling’, or ‘any’ (case-insensitive)

**ftduino\_direct\_get\_version** ()

Returns the ftduino\_direct version

**Returns** A version string.

**ftduino\_id\_get** ()

Returns the ID of the connected ftDuino.

**Returns** The ID of the ftDuino.

**ftduino\_id\_set** (*identifier*)

Sets the ftDuino ID.

**Parameters** **identifier** (*str/unicode*) – The identifier.

**input\_get** (*port*)

Reads a value from the provided input port.

**Parameters** **port** – Port name, i.e. ‘I1’. The port name is case-insensitive.

**Return type** `int`

**Returns** The integer value read from the specified port.

**Raise** `ValueError` in case of an error.

**input\_set\_mode** (*port, mode*)

Sets the mode for the provided input port.

**Parameters**

- **port** – Port name, i.e. ‘I1’. The port name is case-insensitive.
- **mode** – ‘switch’, ‘resistance’, or ‘voltage’ (case-insensitive), see constants `ftdu.INPUT_MODE_SWITCH`, `ftdu.INPUT_MODE_RESISTANCE` and `ftdu.INPUT_MODE_VOLTAGE`.

**Raise** `ValueError` in case the provided mode is unknown.

**led\_set** (*enable*)

Switches the LED on or off

**Parameters** **enable** – True to switch the LED on, False to switch the LED off.

**motor\_counter** (*port, mode, pwm, counter*)

Sets the state of an encoder motor.

**Parameters**

- **port** – Port name, i.e. 'M1'. The port name is case-insensitive.
- **mode** – 'off', 'left', 'right', or 'brake' (case-insensitive), see constants `ftdu.MOTOR_OFF`, `ftdu.MOTOR_LEFT`, `ftdu.MOTOR_RIGHT`, and `ftdu.MOTOR_BRAKE`.
- **pwm** – Pulse-width modulation value.
- **counter** – Counter value. The motor stops after reaching the value.

**motor\_counter\_active** (*port*)

Returns if a counter is active for the given motor port.

**Parameters** **port** – Port name, i.e. 'M1'. The port name is case-insensitive.

**Returns** True if the counter is active, otherwise False.

**motor\_counter\_set\_brake** (*port, enable*)

Indicates if the motor should be stopped indirectly (False) or directly (True).

**Parameters**

- **port** – Port name, i.e. 'M1'. The port name is case-insensitive.
- **enable** – True to set the brake, otherwise False

**motor\_set** (*port, mode, pwm=None*)

Sets the provided motor port into the given state.

**Parameters**

- **port** – Port name, i.e. 'M1'. The port name is case-insensitive.
- **mode** – 'off', 'left', 'right', or 'brake' (case-insensitive), see constants `ftdu.MOTOR_OFF`, `ftdu.MOTOR_LEFT`, `ftdu.MOTOR_RIGHT`, and `ftdu.MOTOR_BRAKE`.
- **pwm** – Pulse-width modulation value. If None the max. PWM value will be used.

**output\_set** (*port, mode, pwm=None*)

Sets the provided output port into the provided mode.

**Parameters**

- **port** – Port name, i.e. 'O1'. The port name is case-insensitive.
- **mode** – 0 = OFF, 1 = HIGH, 2 = LOW
- **pwm** – Pulse-width modulation value. If None the value depends on the mode. If the mode is 1 (high), the pwm will be set to the max. pwm value, otherwise to the min. pwm value.

**ultrasonic\_enable** (*enable*)

Enables / disables the ultrasonic sensor.

**Parameters** **enable** (*bool*) – True to enable, False to disable.

**ultrasonic\_get** ()

Reads and returns the value of the ultrasonic sensor.

**Return type** `int`

**Returns** The value of the ultrasonic sensor.

**class** `ftdu.FtDuino` (*path=None*)

This class provides all functions of the `BaseFtDuino` and adds a higher level API to access ports via attributes.

The red LED can be switched on and off via `led = True` or `led = False`.

```
ftd = FtDuino()
ftd.led = True # Switches the LED on.
```

The input ports can be read by using the port names (i1 .. i8), i.e. `ftd.i1` to get the value of input port “I1”.

The output ports (o1 .. o8) can be enabled / disabled by assigning a boolean value.

Example:

```
ftd = FtDuino()
ftd.o1 = True # Sets the output O1 to HIGH with a max. PWM value
ftd.o2 = False # Sets the output O2 to LOW with a min. PWM value
```

Further, it is possible to specify the PWM value if a tuple is used:

```
ftd = FtDuino()
ftd.o1 = ftd.HIGH, ftd.MAX / 2 # Sets the output O1 to HIGH with half speed
```

This class provides also methods to control motors at the ports M1 .. M4.

```
ftd = FtDuino()
ftd.m1_left() # Rotation left at full speed
ftd.m1_right(pwm=ftd.MAX / 2) # Rotation right with half speed

# Rotation right, full speed, stop after 38 steps (encoder motor)
ftd.m2_right(steps=38)
```

**c1\_clear()**

Clears counter C1 (sets the counter value to zero).

**c2\_clear()**

Clears counter C2 (sets the counter value to zero).

**c3\_clear()**

Clears counter C3 (sets the counter value to zero).

**c4\_clear()**

Clears counter C4 (sets the counter value to zero).

**m1\_brake** (*pwm=None, steps=None*)

Brakes the motor at M1.

See also `motor_counter_set_brake()`

#### Parameters

- **pwm** – Pulse-width modulation value. If `None` the value is set to the maximum.
- **steps** – Number of steps until the motor stops (encoder motor required).

**m1\_left** (*pwm=None, steps=None*)

Sets the rotation of the motor at M1 to “left”.

#### Parameters

- **pwm** – Pulse-width modulation value. If `None` the value is set to the maximum.

- **steps** – Number of steps until the motor stops (encoder motor required).

**m1\_off** (*steps=None*)

Switches the motor at M1 off.

**Parameters** **steps** – Number of steps until the motor stops (encoder motor required).

**m1\_right** (*pwm=None, steps=None*)

Sets the rotation of the motor at M1 to “right”.

**Parameters**

- **pwm** – Pulse-width modulation value. If `None` the value is set to the maximum.
- **steps** – Number of steps until the motor stops (encoder motor required).

**m2\_brake** (*pwm=None, steps=None*)

Brakes the motor at M2.

See also `motor_counter_set_brake()`

**Parameters**

- **pwm** – Pulse-width modulation value. If `None` the value is set to the maximum.
- **steps** – Number of steps until the motor stops (encoder motor required).

**m2\_left** (*pwm=None, steps=None*)

Sets the rotation of the motor at M2 to “left”.

**Parameters**

- **pwm** – Pulse-width modulation value. If `None` the value is set to the maximum.
- **steps** – Number of steps until the motor stops (encoder motor required).

**m2\_off** (*steps=None*)

Switches the motor at M2 off.

**Parameters** **steps** – Number of steps until the motor stops (encoder motor required).

**m2\_right** (*pwm=None, steps=None*)

Sets the rotation of the motor at M2 to “right”.

**Parameters**

- **pwm** – Pulse-width modulation value. If `None` the value is set to the maximum.
- **steps** – Number of steps until the motor stops (encoder motor required).

**m3\_brake** (*pwm=None, steps=None*)

Brakes the motor at M3.

See also `motor_counter_set_brake()`

**Parameters**

- **pwm** – Pulse-width modulation value. If `None` the value is set to the maximum.
- **steps** – Number of steps until the motor stops (encoder motor required).

**m3\_left** (*pwm=None, steps=None*)

Sets the rotation of the motor at M3 to “left”.

**Parameters**

- **pwm** – Pulse-width modulation value. If `None` the value is set to the maximum.
- **steps** – Number of steps until the motor stops (encoder motor required).

**m3\_off** (*steps=None*)

Switches the motor at M3 off.

**Parameters** **steps** – Number of steps until the motor stops (encoder motor required).

**m3\_right** (*pwm=None, steps=None*)

Sets the rotation of the motor at M3 to “right”.

**Parameters**

- **pwm** – Pulse-width modulation value. If `None` the value is set to the maximum.
- **steps** – Number of steps until the motor stops (encoder motor required).

**m4\_brake** (*pwm=None, steps=None*)

Brakes the motor at M4.

See also `motor_counter_set_brake()`

**Parameters**

- **pwm** – Pulse-width modulation value. If `None` the value is set to the maximum.
- **steps** – Number of steps until the motor stops (encoder motor required).

**m4\_left** (*pwm=None, steps=None*)

Sets the rotation of the motor at M4 to “left”.

**Parameters**

- **pwm** – Pulse-width modulation value. If `None` the value is set to the maximum.
- **steps** – Number of steps until the motor stops (encoder motor required).

**m4\_off** (*steps=None*)

Switches the motor at M1 off.

**Parameters** **steps** – Number of steps until the motor stops (encoder motor required).

**m4\_right** (*pwm=None, steps=None*)

Sets the rotation of the motor at M4 to “right”.

**Parameters**

- **pwm** – Pulse-width modulation value. If `None` the value is set to the maximum.
- **steps** – Number of steps until the motor stops (encoder motor required).

**c1**

Returns the value of counter “C1”.

**Return type** `int`

**Returns** The value of counter “C1”.

**c1\_state**

Returns the state of counter “C1”.

**Return type** `bool`

**Returns** `True` if the counter is active, otherwise `False`.

**c2**

Returns the value of counter “C2”.

**Return type** `int`

**Returns** The value of counter “C2”.

**c2\_state**

Returns the state of counter “C2”.

**Return type** `bool`

**Returns** `True` if the counter is active, otherwise `False`.

**c3**

Returns the value of counter “C3”.

**Return type** `int`

**Returns** The value of counter “C3”.

**c3\_state**

Returns the state of counter “C3”.

**Return type** `bool`

**Returns** `True` if the counter is active, otherwise `False`.

**c4**

Returns the value of counter “C4”.

**Return type** `int`

**Returns** The value of counter “C4”.

**c4\_state**

Returns the state of counter “C4”.

**Return type** `bool`

**Returns** `True` if the counter is active, otherwise `False`.

**i1**

Returns the value of input port “I1”.

**Return type** `int`

**Returns** The value of input port “I1”.

**i2**

Returns the value of input port “I2”.

**Return type** `int`

**Returns** The value of input port “I2”.

**i3**

Returns the value of input port “I3”.

**Return type** `int`

**Returns** The value of input port “I3”.

**i4**

Returns the value of input port “I4”.

**Return type** `int`

**Returns** The value of input port “I4”.

**i5**

Returns the value of input port “I5”.

**Return type** `int`

**Returns** The value of input port “I5”.

**i6**

Returns the value of input port “I6”.

**Return type** `int`

**Returns** The value of input port “I6”.

**i7**

Returns the value of input port “I7”.

**Return type** `int`

**Returns** The value of input port “I7”.

**i8**

Returns the value of input port “I8”.

**Return type** `int`

**Returns** The value of input port “I8”.

**m1\_counter\_active**

Returns if the motor counter for port M1 is active.

**Returns** `True` if active, `False` otherwise.

**m2\_counter\_active**

Returns if the motor counter for port M2 is active.

**Returns** `True` if active, `False` otherwise.

**m3\_counter\_active**

Returns if the motor counter for port M3 is active.

**Returns** `True` if active, `False` otherwise.

**m4\_counter\_active**

Returns if the motor counter for port M4 is active.

**Returns** `True` if active, `False` otherwise.

**ultrasonic**

Returns the value of the ultrasonic sensor.

**Return type** `int`

**Returns** The value of the ultrasonic sensor.

`ftdu.ftduino_find_by_name(name)`

Returns the path of the ftDuino with the specified *name*.

**Parameters** **name** – Name of the ftDuino.

**Returns** The path of the ftDuino or `None` if the ftDuino was not found.

`ftdu.ftduino_iter()`

Returns an iterator / generator over all ftDuinos connected to the host device.
